

CCTV Pipeline Inspection

Video pipe inspection can provide you more detailed information on the internal condition of your underground facilities. BTL operates several CCTV units suitable for large storm drain pipes down to smaller diameter residential services. Some of the CCTV units have sondes attached that could be utilized to determine the horizontal location of pipes.

A self-propelled video camera is introduced to pipe lines then the internal features are collected for inspection. Video camera inspection is performed before pipe lines are placed in service to detect possible installation anomalies. Video camera inspection is routinely performed to assess the current condition of pipes in service.
